

## STEPS TO MEASURE A GARAGE DOOR

Please measure your finished frame width (rough opening width) and finished frame height (rough opening height). Our garage doors will likely be greater than these sizes but this is actually the height and width of door you should order.

### STEP 1: DOOR OPENING WIDTH (Figure 2)

Measure the finished frame width in the opening on the widest point. This can be the distance involving the left and right sides in the finished opening. Search for general irregularities, like jambs which are not square.

### STEP 2: DOOR OPENING HEIGHT (Figure 2)

Measure the finished frame height in the opening on the highest point. This can be the distance involving the floor and the top of the finished opening. Search for general irregularities, like un-level floor.

### STEP 3: HEADROOM (Figure 1)

Note: Standard Lift doors require a minimum of 12" of over door height. Not enough headroom? Don't worry. Raynor's Low Headroom Front Mount Springs package reduces the height requirement to 8-1/4" of over door height, while Low Headroom Rear Mount Springs require as little as 4" (plus 2" w/motor operator).

### STEP 4: SIDE ROOM (Figure 1)

Note: A minimum of 3" side room is required with all models.

### STEP 5: BACKROOM (Figure 1)

Note: The minimum backroom requirements are as follows:  
 Standard Lift—door height + 26"  
 Low Headroom Front Mount Springs—door height + 20"  
 Low Headroom Rear Mount Springs—door height + 29"

### STEP 6: OBSTRUCTIONS

Note: Obstructions are defined as entry doors or other objects that will interfere with the garage door track or the operation of a garage door
